Outline

Linear algebra:

- Products (Hadamard, Kronecker, Khatri-Rao)
- Separation of variables
- Singular value decomposition (SVD)

3 tensor decomposition models:

- Canonical polyadic (CP)
- Tucker
- Tensor train

Products (Hadamard, Kronecker, Khatri-Rao)

Hadamard
(elementwise)

$$\mathbf{A} * \mathbf{B} = \begin{bmatrix} a_{1,1}b_{1,1} & a_{1,2}b_{1,2} & \cdots & a_{1,J}b_{1,J} \\ a_{2,1}b_{2,1} & a_{2,2}b_{2,2} & \cdots & a_{2,J}b_{2,J} \\ \vdots & \vdots & \ddots & \vdots \\ a_{I,1}b_{I,1} & a_{I,2}b_{I,2} & \cdots & a_{I,J}b_{I,J} \end{bmatrix}$$

$$\begin{aligned} \mathbf{A} &\in \mathbb{R}^{I \times J} \\ \mathbf{B} &\in \mathbb{R}^{I \times J} \\ \mathbf{A} * \mathbf{B} &\in \mathbb{R}^{I \times J} \end{aligned}$$

Kronecker

$$\mathbf{A} \otimes \mathbf{B} = \begin{bmatrix} a_{1,1}\mathbf{B} & a_{1,2}\mathbf{B} & \cdots & a_{1,J}\mathbf{B} \\ a_{2,1}\mathbf{B} & a_{2,2}\mathbf{B} & \cdots & a_{2,J}\mathbf{B} \\ \vdots & \vdots & \ddots & \vdots \\ a_{I,1}\mathbf{B} & a_{I,2}\mathbf{B} & \cdots & a_{I,J}\mathbf{B} \end{bmatrix}$$

$$\begin{aligned} \mathbf{A} &\in \mathbb{R}^{I \times J} \\ \mathbf{B} &\in \mathbb{R}^{K \times L} \\ \mathbf{A} \otimes \mathbf{B} &\in \mathbb{R}^{IK \times JL} \end{aligned}$$

Khatri-Rao

$$\mathbf{A} \odot \mathbf{B} = \begin{bmatrix} a_{1,1}\mathbf{b}_1 & a_{1,2}\mathbf{b}_2 & \cdots & a_{1,K}\mathbf{b}_K \\ a_{2,1}\mathbf{b}_1 & a_{2,2}\mathbf{b}_2 & \cdots & a_{2,K}\mathbf{b}_K \\ \vdots & \vdots & \ddots & \vdots \\ a_{I,1}\mathbf{b}_1 & a_{I,2}\mathbf{b}_2 & \cdots & a_{I,K}\mathbf{b}_K \end{bmatrix}$$

$$\begin{aligned} \mathbf{A} &\in \mathbb{R}^{I \times K} \\ \mathbf{B} &\in \mathbb{R}^{J \times K} \\ \mathbf{A} \odot \mathbf{B} &\in \mathbb{R}^{IJ \times K} \end{aligned}$$

Hadamard (elementwise) product - Example

$$\begin{bmatrix} \text{light blue} & \text{pink} \\ \text{blue} & \text{red} \\ \text{dark blue} & \text{dark red} \end{bmatrix}$$

A

$$\begin{bmatrix} \text{light green} & \text{purple} \\ \text{green} & \text{dark purple} \\ \text{dark green} & \text{dark purple} \end{bmatrix}$$

B

$$A * B = \begin{bmatrix} \text{light blue} & \text{light green} & \text{pink} & \text{purple} \\ \text{blue} & \text{green} & \text{red} & \text{dark purple} \\ \text{dark blue} & \text{dark green} & \text{dark red} & \text{purple} \end{bmatrix}$$

$$A \in \mathbb{R}^{3 \times 2}$$

$$B \in \mathbb{R}^{3 \times 2}$$

$$A * B \in \mathbb{R}^{3 \times 2}$$

Kronecker product - Example

$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$$

$$B = \begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \\ 9 & 10 & 11 & 12 \\ 13 & 14 & 15 & 16 \\ 17 & 18 & 19 & 20 \end{bmatrix}$$

$$A \otimes B =$$

$$\begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \\ 9 & 10 & 11 & 12 \\ 13 & 14 & 15 & 16 \\ 17 & 18 & 19 & 20 \end{bmatrix} \otimes \begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \\ 9 & 10 & 11 & 12 \\ 13 & 14 & 15 & 16 \\ 17 & 18 & 19 & 20 \end{bmatrix}$$

$$A \otimes B = \begin{bmatrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15 & 16 \\ 5 & 6 & 7 & 8 & 1 & 2 & 3 & 4 & 17 & 18 & 19 & 20 & 13 & 14 & 15 & 16 \\ 9 & 10 & 11 & 12 & 17 & 18 & 19 & 20 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 \\ 13 & 14 & 15 & 16 & 13 & 14 & 15 & 16 & 17 & 18 & 19 & 20 & 1 & 2 & 3 & 4 \\ 17 & 18 & 19 & 20 & 17 & 18 & 19 & 20 & 13 & 14 & 15 & 16 & 5 & 6 & 7 & 8 \end{bmatrix}$$

$$A \in \mathbb{R}^{3 \times 2}$$

$$B \in \mathbb{R}^{5 \times 4}$$

$$A \otimes B \in \mathbb{R}^{15 \times 8}$$

Khatri-Rao product - Example

A

B

$$A \odot B =$$

The figure consists of three horizontal rows of four colored rectangles each. A vertical black bar is positioned on the far left.

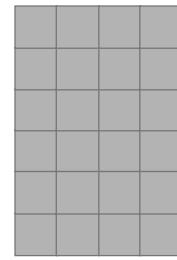

- Row 1:** Contains a blue rectangle, a light green rectangle, a red rectangle, and a dark green rectangle.
- Row 2:** Contains a blue rectangle, a light green rectangle, a red rectangle, and a dark green rectangle.
- Row 3:** Contains a dark blue rectangle, a light green rectangle, a red rectangle, and a dark green rectangle.

$$\begin{aligned} \mathbf{A} &\in \mathbb{R}^{3 \times 2} \\ \mathbf{B} &\in \mathbb{R}^{5 \times 2} \\ \mathbf{A} \odot \mathbf{B} &\in \mathbb{R}^{15 \times 2} \end{aligned}$$

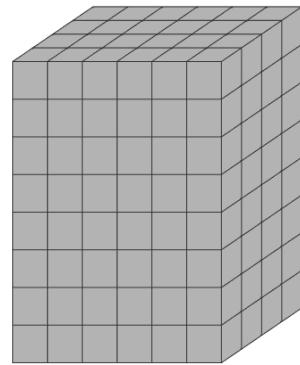

Tensors

1st-order
tensors

2nd-order
tensors

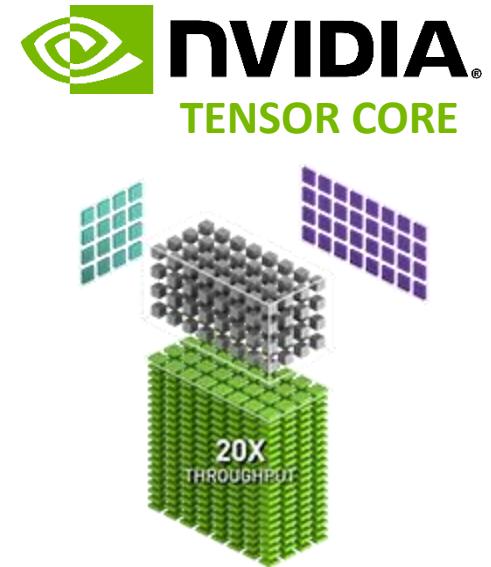

3rd-order
tensors

...

Images: 3D tensors
(width, height, color channels)

Videos: 4D tensors
(frame, width, height, color channels)

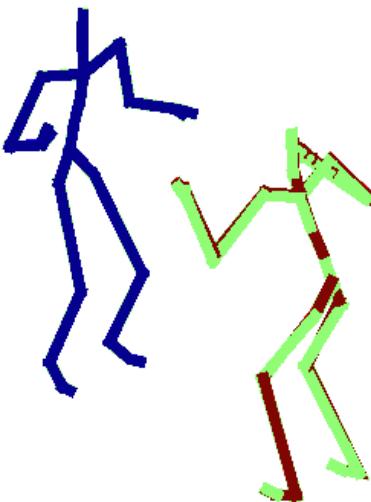

- Tensors appear in various forms:**
 - Raw data
(*arrays of sensors, multidimensional channels*)
 - Data evolution over time window
(*sets of short sequences*)
 - Data in multiple coordinate systems
 - Basis functions expansion

Tensor methods – Motivation

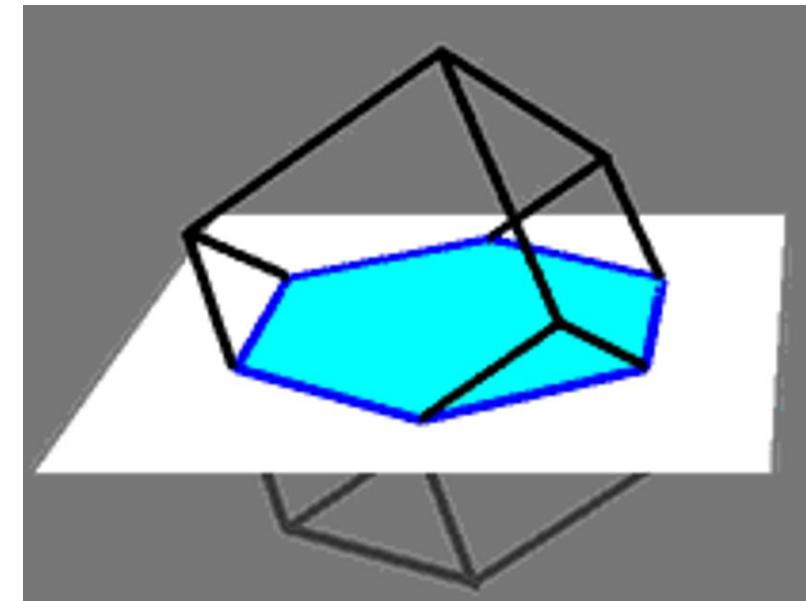

agent
 sample
 joint
 coordinate
 time step

$$\boldsymbol{x} \in \mathbb{R}^{10 \times 2 \times 31 \times 3 \times 100} \quad \boldsymbol{X} \in \mathbb{R}^{10 \times 18600}$$

Tensor factorization
→ Multiway analysis of the data

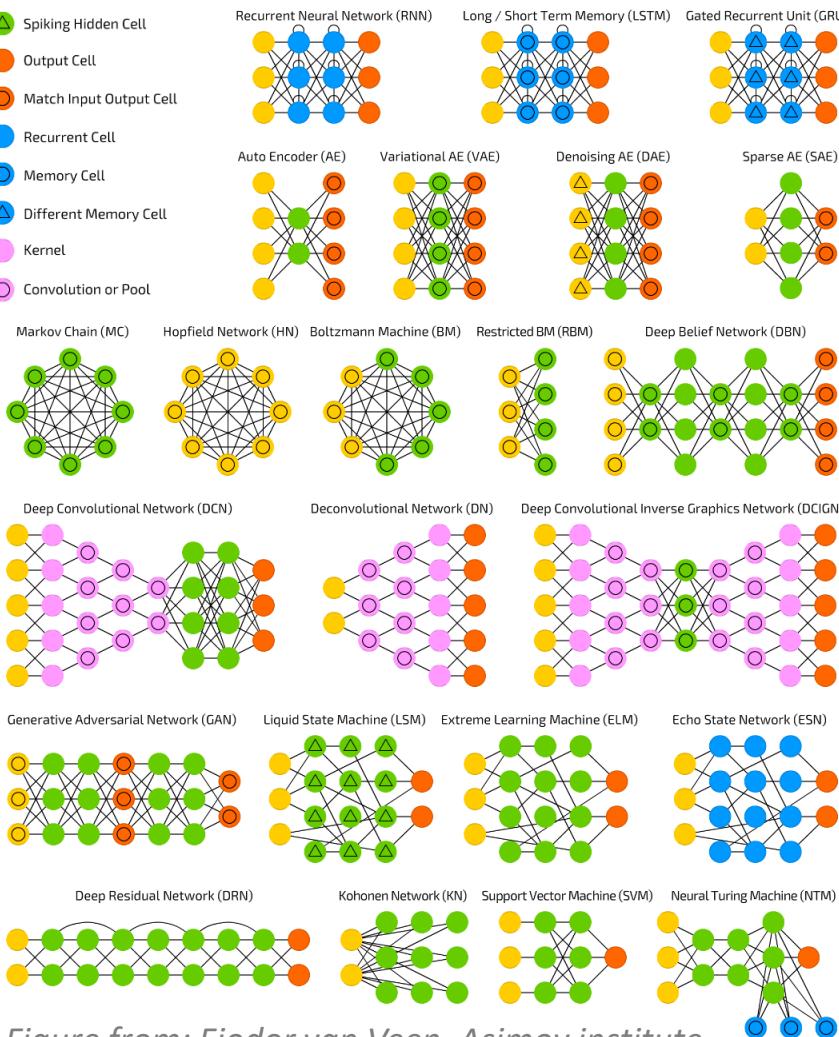

Couldn't we simply vectorize/flatten our data before further processing?

Neural networks

Tensor networks

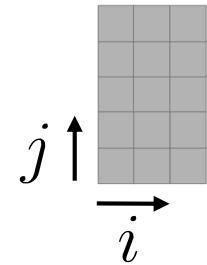

Figures from: Andrzej CICHOCKI (2014), Era of Big Data Processing: A New Approach via Tensor Networks and Tensor Decompositions

Separation of variables: a factorization problem

Matrix factorization with standard linear algebra:

$$\mathbf{X} = \mathbf{U} \Sigma \mathbf{V}^\top$$

(singular value decomposition)

Rank-1 decomposition:

$$\mathbf{X}_{i,j} = \mathbf{U}_i \mathbf{V}_j \rightarrow \text{Representation in a separable form}$$

Rank-R decomposition:

$$\mathbf{X}_{i,j} = \sum_{r=1}^R \mathbf{U}_{i,r} \mathbf{V}_{j,r} \quad \mathbf{X} = \mathbf{U} \mathbf{V}^\top$$

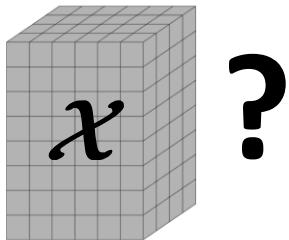

(in matrix form)

Extension to data with more indices (tensors):

$$\mathbf{X}_{i,j,k,\dots} = \sum_{r=1}^R \mathbf{U}_{i,r} \mathbf{V}_{j,r} \mathbf{W}_{k,r} \dots$$

(CP decomposition)

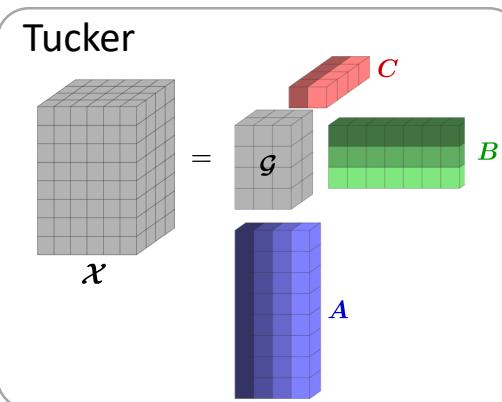

Data structured as tensors

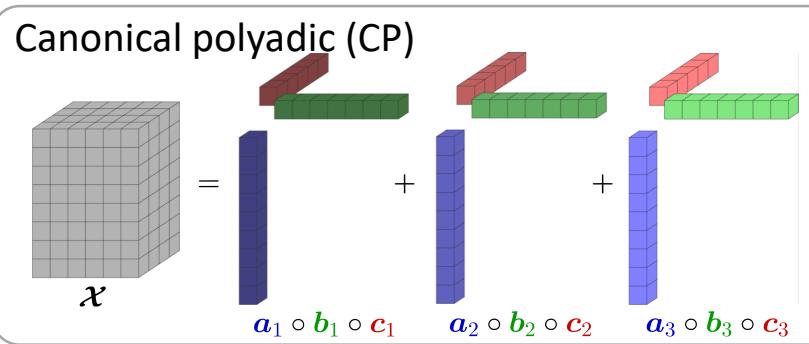

Matrix factorization with standard linear algebra:

$$X = U \Sigma V^\top$$

Technology)

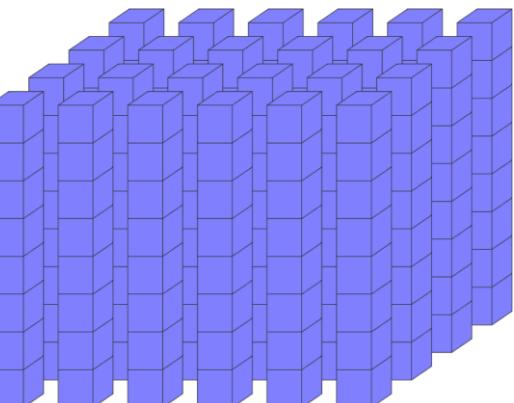

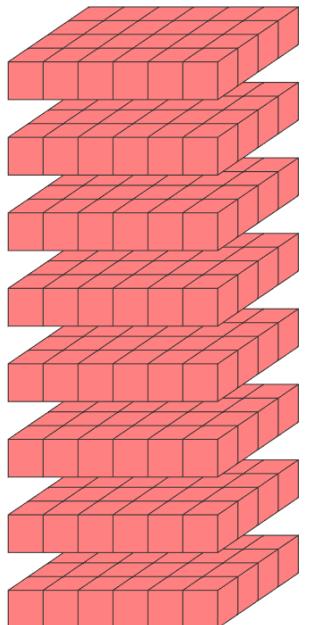

Tensor indexing - Slices and fibers

$$\mathcal{X} \in \mathbb{R}^{8 \times 6 \times 4}$$

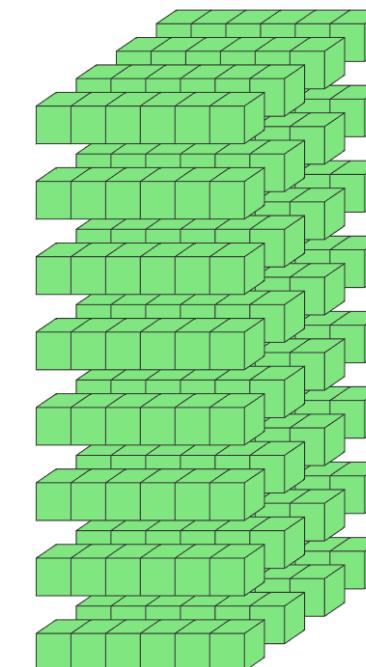

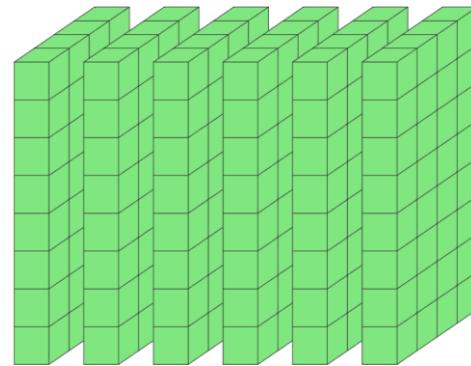

- \mathcal{X} tensor
- X matrix
- x vector
- x scalar

$X_{i,:,:}$ (horizontal slice)

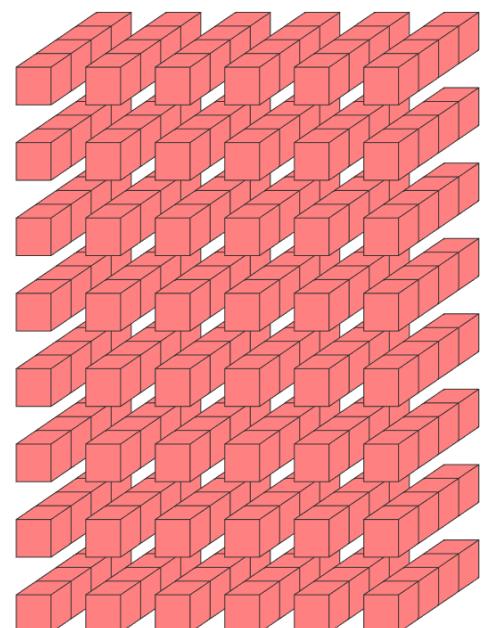

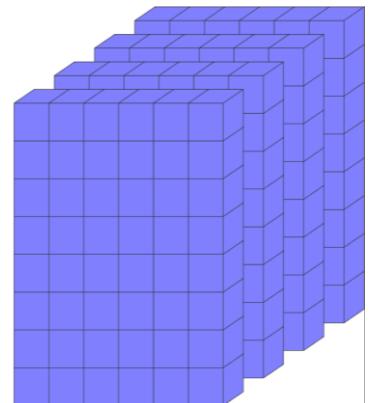

$\mathcal{x}_{:,j,k}$ (column fiber)

$X_{:,:,k}$ (lateral slice)

$\mathcal{x}_{i,:,k}$ (row fiber)

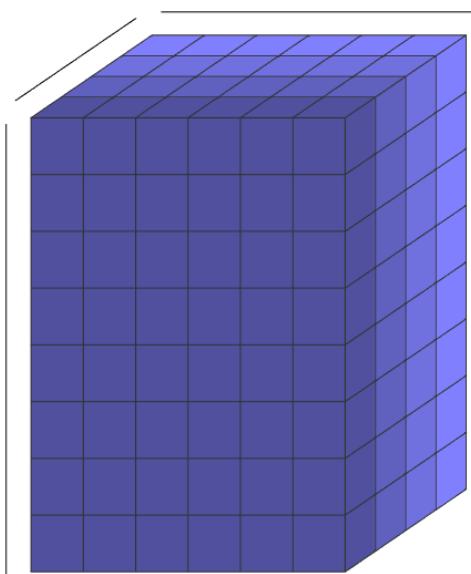

$X_{:,:,k}$ (frontal slice)

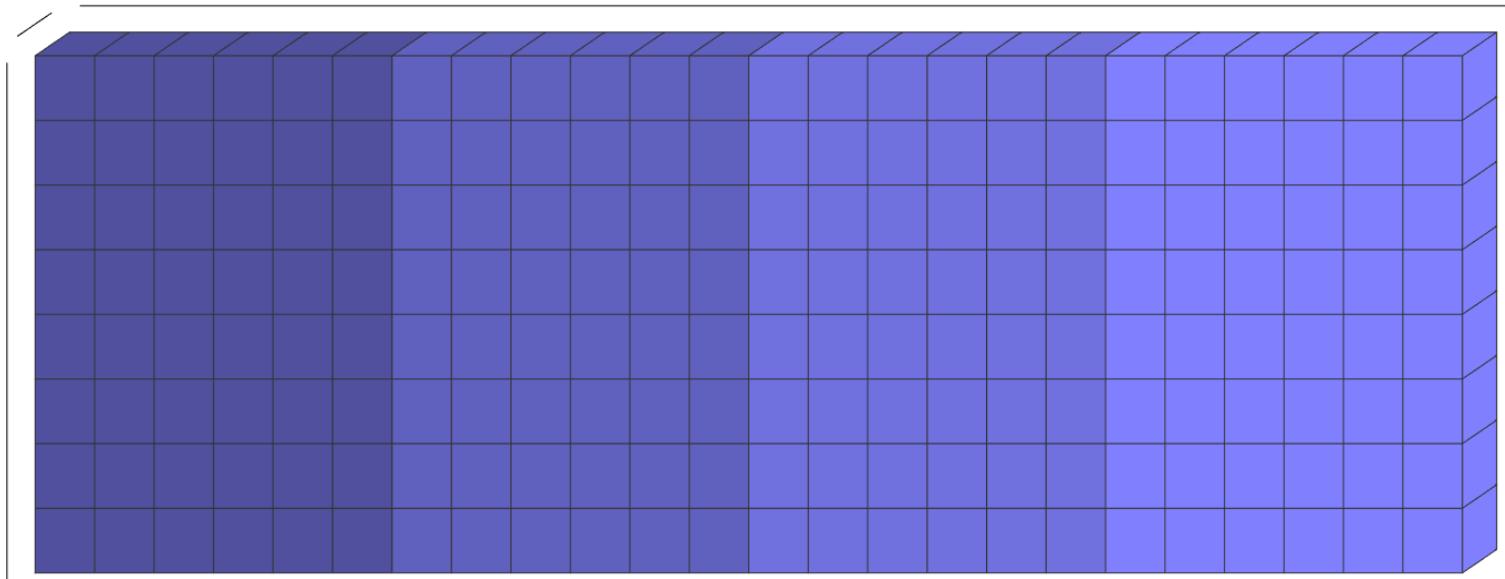

$\mathcal{x}_{i,j,:}$ (tube fiber)

Tensor matricization / unfolding

A matrix $\mathbf{X}_{(n)} \in \mathbb{R}^{I_n \times (I_1 \cdots I_{n-1} I_{n+1} \cdots I_N)}$ results from the mode- n matricization (unfolding) of a tensor $\mathcal{X} \in \mathbb{R}^{I_1 \times I_2 \times \cdots \times I_N}$, which consists of turning the mode- n fibers of \mathcal{X} into the columns of a matrix $\mathbf{X}_{(n)}$.

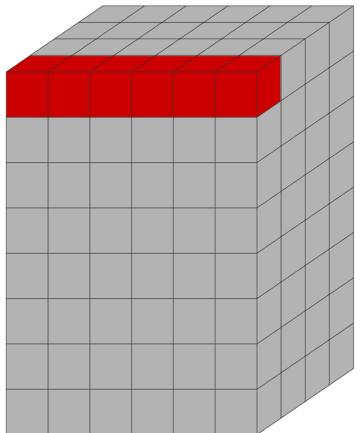

$$\mathcal{X} \in \mathbb{R}^{8 \times 6 \times 4}$$

$$\mathbf{X}_{(1)} \in \mathbb{R}^{8 \times 24}$$

(mode-1 unfolding)

Modern product

$$\times_n$$

$$\mathcal{X} \in \mathbb{R}^{I_1 \times I_2 \times \dots \times I_N}$$

$$\mathbf{M} \in \mathbb{R}^{J \times I_n}$$

$$\mathcal{Y} \in \mathbb{R}^{I_1 \times \dots \times I_{n-1} \times J \times I_{n+1} \times \dots \times I_N}$$

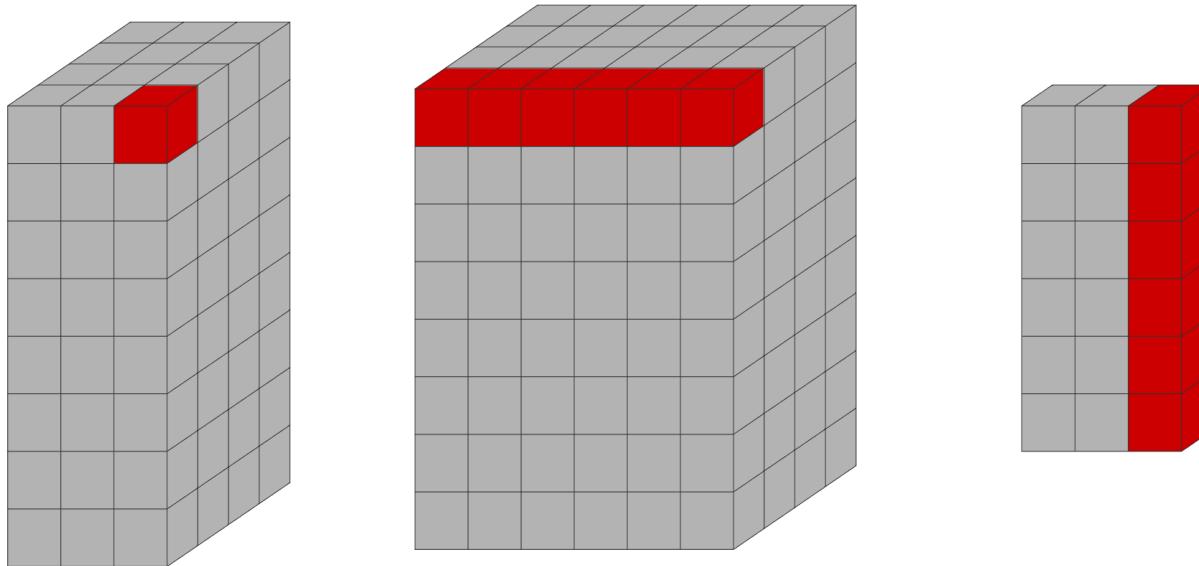

$$\mathcal{Y} = \mathcal{X} \times_n \mathbf{M}$$

$$\mathbf{Y}_{(n)} = \mathbf{M} \mathbf{X}_{(n)} \quad (\text{matricized form})$$

$$y_{i_1, \dots, i_{n-1}, j, i_{n+1}, \dots, i_N} = \sum_{i_n=1}^{I_n} x_{i_1, \dots, i_N} m_{j, i_n} \quad (\text{elementwise})$$

Intuitively, the operation corresponds to multiplying each mode- n fiber of \mathcal{X} by the matrix \mathbf{M} .

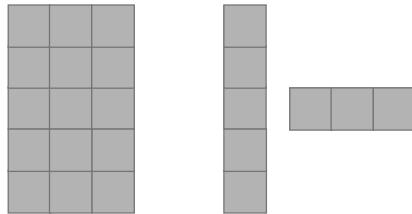

Modern product - Example

$$Y = X \times_2 M$$

$$\begin{aligned}X &\in \mathbb{R}^{8 \times 6 \times 4} \\M &\in \mathbb{R}^{6 \times 3} \\Y &\in \mathbb{R}^{8 \times 3 \times 4}\end{aligned}$$

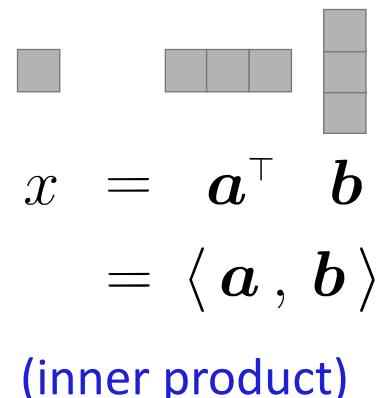

Outer product and inner product

The **outer product** of two vectors $\mathbf{a} \in \mathbb{R}^I$ and $\mathbf{b} \in \mathbb{R}^J$ results in a matrix $\mathbf{X} \in \mathbb{R}^{I \times J}$ denoted by $\mathbf{X} = \mathbf{a} \circ \mathbf{b} = \mathbf{ab}^\top$.

$$\begin{aligned} \mathbf{X} &= \mathbf{a} \quad \mathbf{b}^\top \\ &= \mathbf{a} \circ \mathbf{b} \\ (\text{outer product}) \end{aligned}$$

The **outer product** of three (or more) vectors $\mathbf{a} \in \mathbb{R}^I$, $\mathbf{b} \in \mathbb{R}^J$ and $\mathbf{c} \in \mathbb{R}^K$ results in a tensor $\mathbf{x} \in \mathbb{R}^{I \times J \times K}$ denoted by $\mathbf{x} = \mathbf{a} \circ \mathbf{b} \circ \mathbf{c}$ with elements $x_{i,j,k} = a_i b_j c_k$.

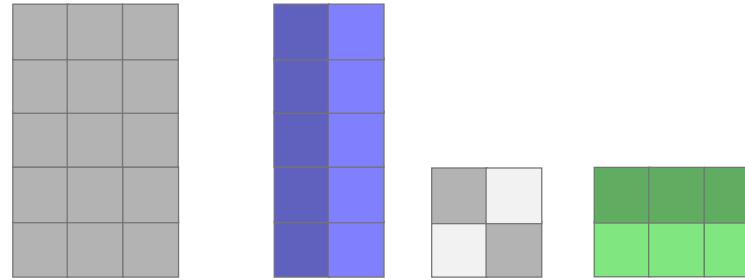

The **inner product** of two vectors $\mathbf{a} \in \mathbb{R}^I$ and $\mathbf{b} \in \mathbb{R}^I$ results in a scalar $x = \langle \mathbf{a}, \mathbf{b} \rangle = \mathbf{a}^\top \mathbf{b} = \sum_{i=1}^I a_i b_i$.

The formulation can be extended to tensors \mathcal{A} and \mathcal{B} of the same size. We have

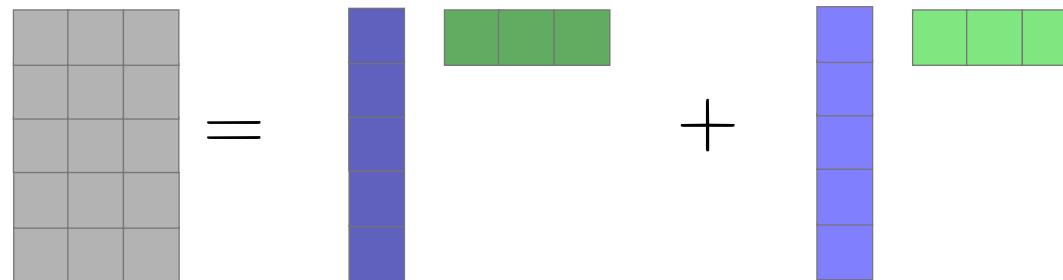

$$\langle \mathcal{A}, \mathcal{B} \rangle = \langle \mathcal{A}_{(n)}, \mathcal{B}_{(n)} \rangle = \langle \text{vec}(\mathcal{A}), \text{vec}(\mathcal{B}) \rangle.$$

Singular value decomposition (SVD)

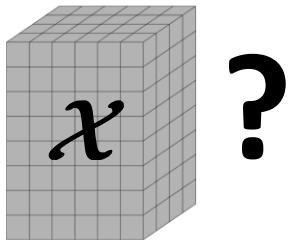

$$X = U \Sigma V^\top$$

$$\begin{aligned} \tilde{u}_i = \sigma_i u_i &= \sigma_1^2 u_1 v_1^\top + \sigma_2^2 u_2 v_2^\top \\ \tilde{v}_i = \sigma_i v_i &= \tilde{u}_1 \tilde{v}_1^\top + \tilde{u}_2 \tilde{v}_2^\top \\ &= \tilde{u}_1 \circ \tilde{v}_1 + \tilde{u}_2 \circ \tilde{v}_2 \end{aligned}$$

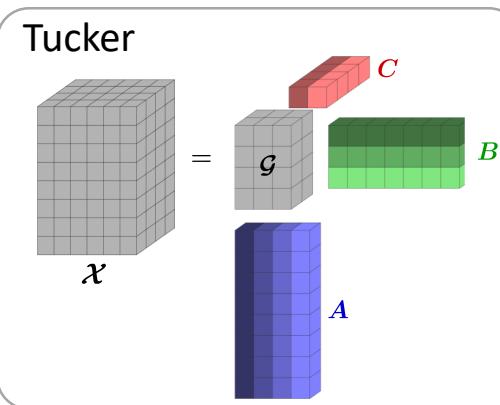

Data structured as tensors

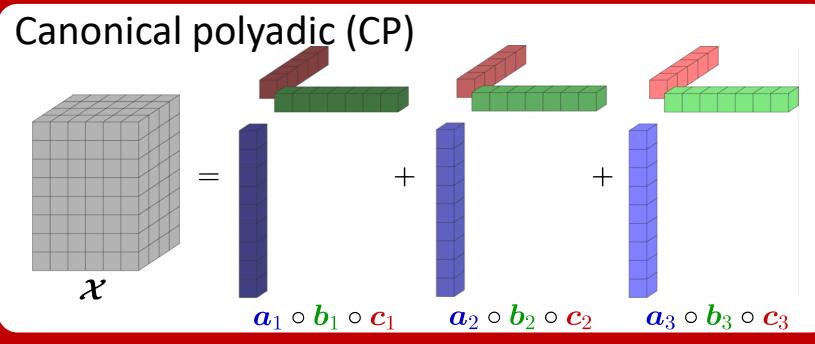

Matrix factorization with standard linear algebra:

$$X = U \Sigma V^\top$$

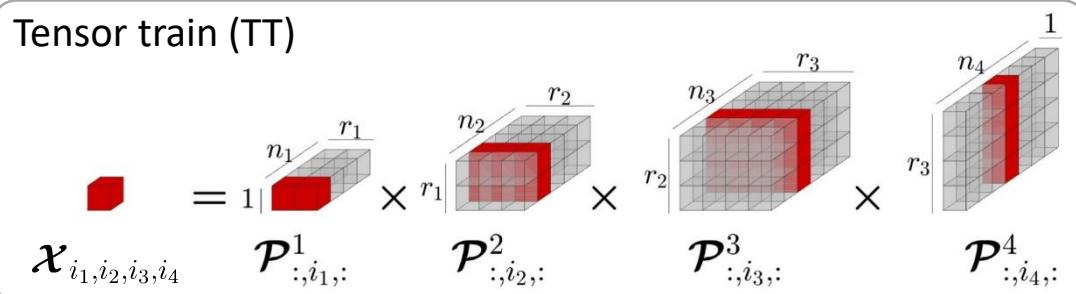

Tensor methods

Anima Anandkumar
(California Institute of Technology and NVIDIA)

Lieven De Lathauwer
(KU Leuven)

Ivan Oseledets
(Skolkovo Institute of Science and Technology)

CP decomposition

$$\mathcal{X} = \mathbf{a}_1 \circ \mathbf{b}_1 \circ \mathbf{c}_1 + \mathbf{a}_2 \circ \mathbf{b}_2 \circ \mathbf{c}_2 + \mathbf{a}_3 \circ \mathbf{b}_3 \circ \mathbf{c}_3$$

$$\mathcal{X} = \mathbf{A} = [\mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_3] \mathbf{B} = [\mathbf{b}_1, \mathbf{b}_2, \mathbf{b}_3] \mathbf{C} = [\mathbf{c}_1, \mathbf{c}_2, \mathbf{c}_3]$$

CP decomposition

$$\begin{aligned}\boldsymbol{\chi} &= \sum_{j=1}^r \mathbf{a}_j \circ \mathbf{b}_j \circ \mathbf{c}_j \\ &= [\![\mathbf{A}, \mathbf{B}, \mathbf{C}]\!]\end{aligned}$$

Matricized form:

$$\begin{aligned}\mathbf{X}_{(1)} &= \mathbf{A}(\mathbf{C} \odot \mathbf{B})^\top \\ \mathbf{X}_{(2)} &= \mathbf{B}(\mathbf{C} \odot \mathbf{A})^\top \\ \mathbf{X}_{(3)} &= \mathbf{C}(\mathbf{B} \odot \mathbf{A})^\top\end{aligned}$$

Vectorized form: $\text{vec}(\boldsymbol{\chi}) = (\mathbf{C} \odot \mathbf{B} \odot \mathbf{A}) \mathbf{1}_R$

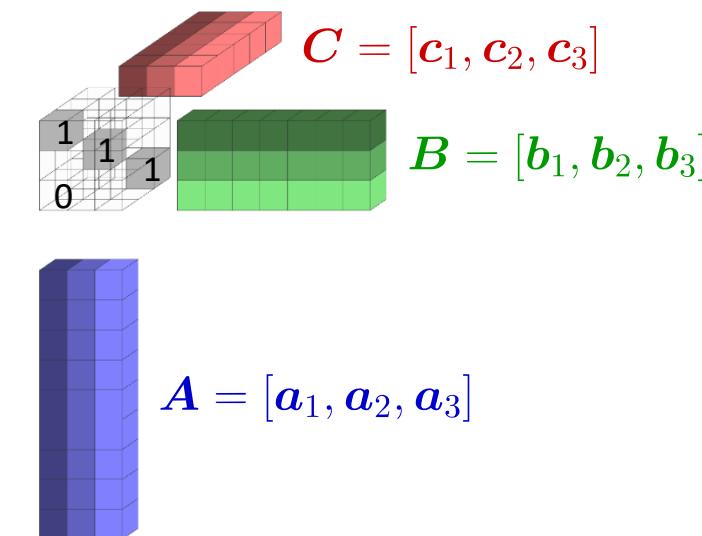

Elementwise:

$$x_{i_1, i_2, i_3} = \sum_{j=1}^r a_{i_1, j} b_{i_2, j} c_{i_3, j}$$

$\mathbf{A} = [\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_r]$ is called a factor matrix.

The **tensor rank** r corresponds to the smallest number of components required in the CP decomposition.

$$\begin{aligned}\boldsymbol{\chi} &\in \mathbb{R}^{n_1 \times n_2 \times n_3} \\ \mathbf{A} &\in \mathbb{R}^{n_1 \times r} \\ \mathbf{B} &\in \mathbb{R}^{n_2 \times r} \\ \mathbf{C} &\in \mathbb{R}^{n_3 \times r}\end{aligned}$$

CP parameters estimation: Alternating least squares (ALS)

The CP decomposition can be solved by alternating least squares (ALS),
by repeating

$$\mathbf{A} \leftarrow \arg \min_{\mathbf{A}} \|\mathbf{X}_{(1)} - \mathbf{A}(\mathbf{C} \odot \mathbf{B})^\top\|_F^2$$

$$\mathbf{B} \leftarrow \arg \min_{\mathbf{B}} \|\mathbf{X}_{(2)} - \mathbf{B}(\mathbf{C} \odot \mathbf{A})^\top\|_F^2$$

$$\mathbf{C} \leftarrow \arg \min_{\mathbf{C}} \|\mathbf{X}_{(3)} - \mathbf{C}(\mathbf{B} \odot \mathbf{A})^\top\|_F^2$$

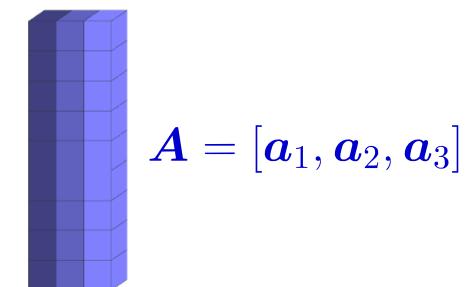

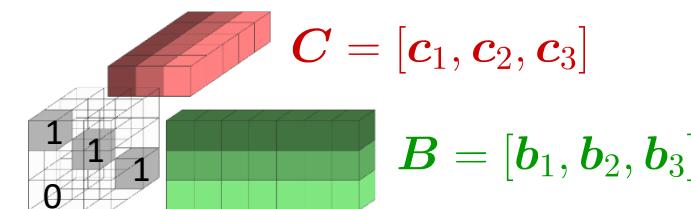

until convergence, yielding the update rules

$$\mathbf{A} \leftarrow \mathbf{X}_{(1)} \left((\mathbf{C} \odot \mathbf{B})^\top \right)^\dagger$$

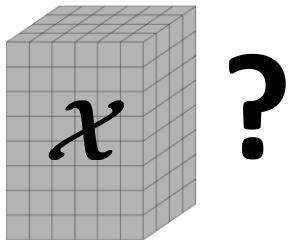

$$\mathbf{B} \leftarrow \mathbf{X}_{(2)} \left((\mathbf{C} \odot \mathbf{A})^\top \right)^\dagger$$

$$\mathbf{C} \leftarrow \mathbf{X}_{(3)} \left((\mathbf{B} \odot \mathbf{A})^\top \right)^\dagger$$

$$\begin{aligned}\mathbf{x} &\in \mathbb{R}^{n_1 \times n_2 \times n_3} \\ \mathbf{A} &\in \mathbb{R}^{n_1 \times r} \\ \mathbf{B} &\in \mathbb{R}^{n_2 \times r} \\ \mathbf{C} &\in \mathbb{R}^{n_3 \times r}\end{aligned}$$

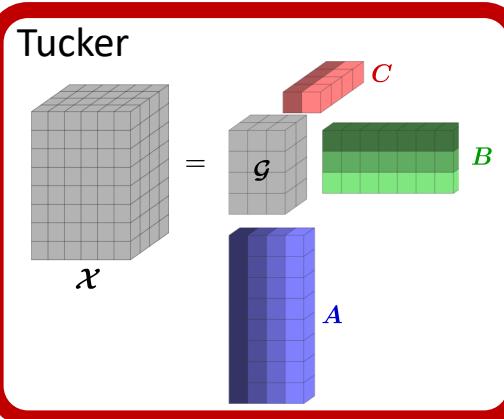

Data structured as tensors

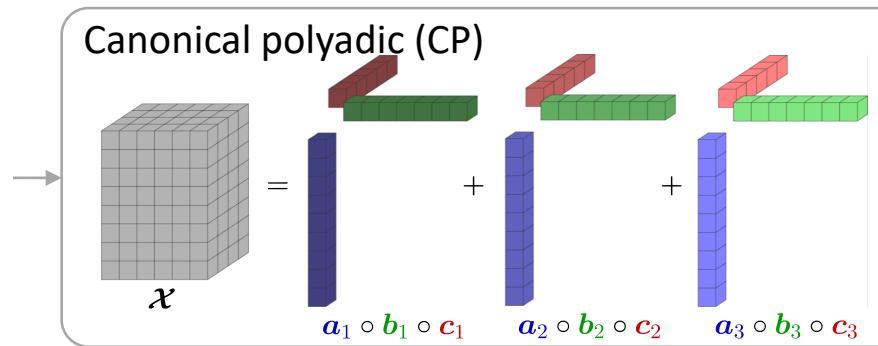

Matrix factorization with standard linear algebra:

$$X = U \Sigma V^\top$$

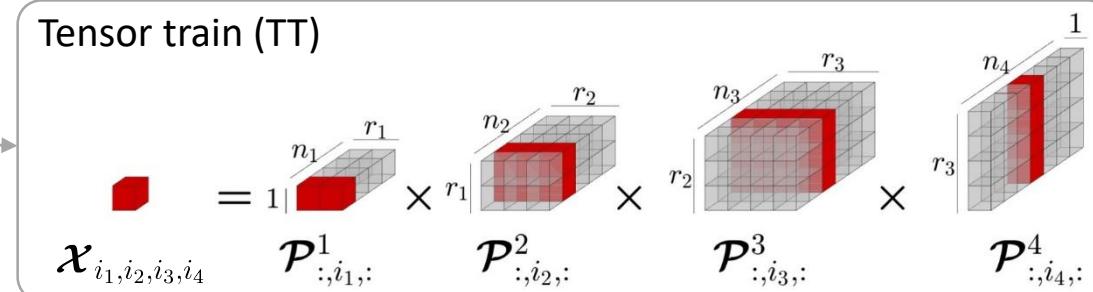

Tensor methods

Anima Anandkumar
(California Institute of Technology and NVIDIA)

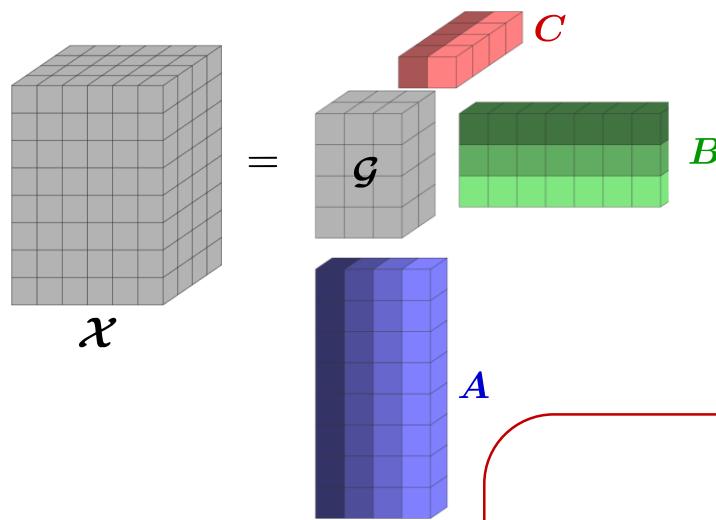

Lieven De Lathauwer
(KU Leuven)

Ivan Oseledets
(Skolkovo Institute of Science and Technology)

Tucker decomposition

$\mathcal{X} \in \mathbb{R}^{n_1 \times n_2 \times n_3}$
$\mathcal{G} \in \mathbb{R}^{r_1 \times r_2 \times r_3}$
$A \in \mathbb{R}^{n_1 \times r_1}$
$B \in \mathbb{R}^{n_2 \times r_2}$
$C \in \mathbb{R}^{n_3 \times r_3}$

Core tensor

$$\begin{aligned}\mathcal{X} &= \sum_{j_1=1}^{r_1} \sum_{j_2=1}^{r_2} \sum_{j_3=1}^{r_3} g_{j_1,j_2,j_3} \mathbf{a}_{j_1} \circ \mathbf{b}_{j_2} \circ \mathbf{c}_{j_3} \\ &= \mathcal{G} \times_1 A \times_2 B \times_3 C \\ &= [\mathcal{G}; A, B, C]\end{aligned}$$

Matricized form:

$$\begin{aligned}\mathbf{X}_{(1)} &= A\mathcal{G}_{(1)}(\mathbf{C} \otimes \mathbf{B})^\top \\ \mathbf{X}_{(2)} &= B\mathcal{G}_{(2)}(\mathbf{C} \otimes \mathbf{A})^\top \\ \mathbf{X}_{(3)} &= C\mathcal{G}_{(3)}(\mathbf{B} \otimes \mathbf{A})^\top\end{aligned}$$

Elementwise:

$$x_{i_1,i_2,i_3} = \sum_{j_1=1}^{r_1} \sum_{j_2=1}^{r_2} \sum_{j_3=1}^{r_3} g_{j_1,j_2,j_3} a_{i_1,j_1} b_{i_2,j_2} c_{i_3,j_3}$$

Tucker parameters estimation: Higher-order SVD (H0-SVD)

The problem can be recast as a series of maximization subproblems

$$\begin{aligned}\mathbf{A} &\leftarrow \arg \max_{\mathbf{A}} \|\mathbf{A}^\top \mathbf{X}_{(1)} (\mathbf{C} \otimes \mathbf{B})\|_F^2 \quad \text{s.t.} \quad \mathbf{A}^\top \mathbf{A} = \mathbf{I}_{r_1} \\ \mathbf{B} &\leftarrow \arg \max_{\mathbf{B}} \|\mathbf{B}^\top \mathbf{X}_{(2)} (\mathbf{C} \otimes \mathbf{A})\|_F^2 \quad \text{s.t.} \quad \mathbf{B}^\top \mathbf{B} = \mathbf{I}_{r_2} \\ \mathbf{C} &\leftarrow \arg \max_{\mathbf{C}} \|\mathbf{C}^\top \mathbf{X}_{(3)} (\mathbf{B} \otimes \mathbf{A})\|_F^2 \quad \text{s.t.} \quad \mathbf{C}^\top \mathbf{C} = \mathbf{I}_{r_3}\end{aligned}$$

which can be solved by repeating

$$\begin{aligned}\mathbf{A} &\leftarrow P \text{ leading singular vectors of } \mathbf{X}_{(1)} (\mathbf{C} \otimes \mathbf{B}) \\ \mathbf{B} &\leftarrow Q \text{ leading singular vectors of } \mathbf{X}_{(2)} (\mathbf{C} \otimes \mathbf{A}) \\ \mathbf{C} &\leftarrow R \text{ leading singular vectors of } \mathbf{X}_{(3)} (\mathbf{B} \otimes \mathbf{A})\end{aligned}$$

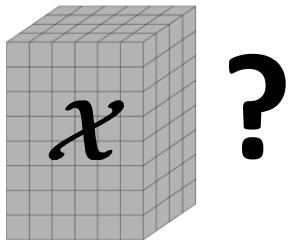

until convergence, with \mathbf{G} finally evaluated as

$$\mathbf{G} \leftarrow \mathbf{\mathcal{X}} \times_1 \mathbf{A}^\top \times_2 \mathbf{B}^\top \times_3 \mathbf{C}^\top$$

$$\begin{aligned}\mathbf{\mathcal{X}} &\in \mathbb{R}^{n_1 \times n_2 \times n_3} \\ \mathbf{G} &\in \mathbb{R}^{r_1 \times r_2 \times r_3} \\ \mathbf{A} &\in \mathbb{R}^{n_1 \times r_1} \\ \mathbf{B} &\in \mathbb{R}^{n_2 \times r_2} \\ \mathbf{C} &\in \mathbb{R}^{n_3 \times r_3}\end{aligned}$$

In contrast to CP, the Tucker decomposition is generally not unique
→ A, B and C constrained to be orthogonal matrices

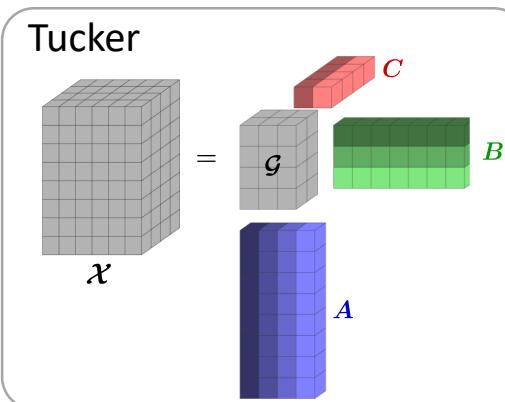

Data structured as tensors

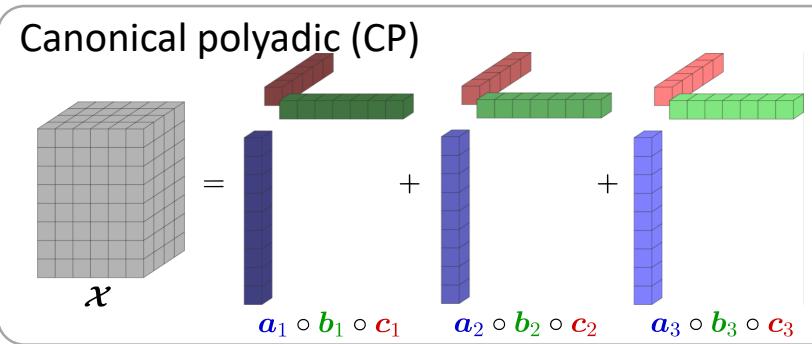

Matrix factorization with standard linear algebra:

$$X = U \Sigma V^\top$$

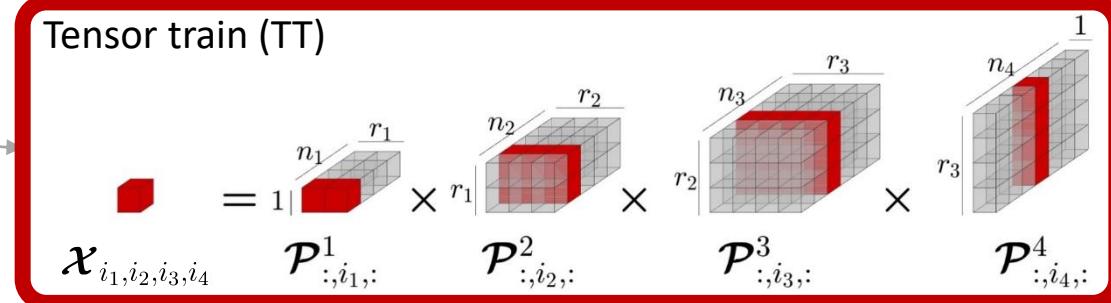

Tensor methods

Tensor train parameters estimation: TT-SVD

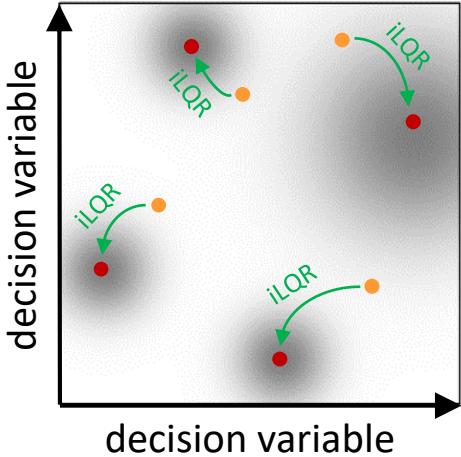

$$\mathcal{X} \in \mathbb{R}^{n_1 \times n_2 \times n_3 \times n_4}$$

$$\mathcal{P}^k \in \mathbb{R}^{r_{k-1} \times n_k \times r_k}$$

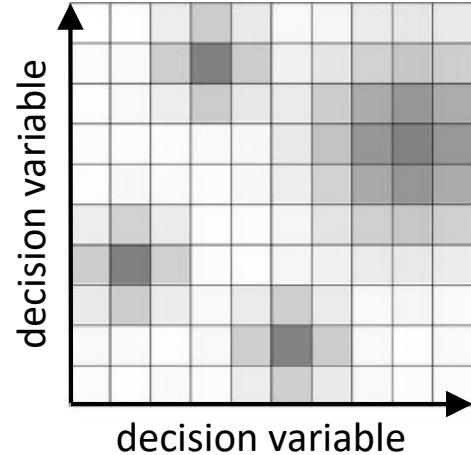

- \mathcal{X} is reshaped as a $n_1 \times n_2 n_3 n_4$ matrix \mathbf{X}_1
- $\mathbf{X}_1 \approx \mathbf{U}_1 \mathbf{S}_1 \mathbf{V}_1^\top$, where \mathbf{U}_1 is a $n_1 \times r_1$ matrix, reshaped as 1st core \mathcal{P}^1
- $\mathbf{S}_1 \mathbf{V}_1^\top$ is a $r_1 \times n_2 n_3 n_4$ matrix reshaped into a $r_1 n_2 \times n_3 n_4$ matrix \mathbf{X}_2
- $\mathbf{X}_2 \approx \mathbf{U}_2 \mathbf{S}_2 \mathbf{V}_2^\top$, where \mathbf{U}_2 is a $r_1 n_2 \times r_2$ matrix, reshaped as 2nd core \mathcal{P}^2
- $\mathbf{S}_2 \mathbf{V}_2^\top$ is a $r_2 \times n_3 n_4$ matrix reshaped into a $r_2 n_3 \times n_4$ matrix \mathbf{X}_3
- $\mathbf{X}_3 \approx \mathbf{U}_3 \mathbf{S}_3 \mathbf{V}_3^\top$, where \mathbf{U}_3 is a $r_2 n_3 \times r_3$ matrix, reshaped as 3rd core \mathcal{P}^3
- $\mathbf{S}_3 \mathbf{V}_3^\top$ is a $r_3 \times n_4$ matrix, reshaped as 4th core \mathcal{P}^4

Example: Tensor train for global optimization

For 2D decision variable:

For nD decision variable:

$$\mathcal{X}_{i_1, i_2, i_3, i_4} = 1 | \begin{array}{c} n_1 \\ \hline r_1 \end{array} \times \begin{array}{c} n_2 \\ \hline r_2 \end{array} \times \begin{array}{c} n_3 \\ \hline r_3 \end{array} \times \begin{array}{c} n_4 \\ \hline r_3 \end{array} \times \begin{array}{c} 1 \\ \hline r_4 \end{array} | \mathcal{P}_{:, i_1, :}^1 \times \mathcal{P}_{:, i_2, :}^2 \times \mathcal{P}_{:, i_3, :}^3 \times \mathcal{P}_{:, i_4, :}^4$$

Tensor train (TT)

Example: Tensor train for global optimization

Cross approximation (skeleton decomposition) of a probability distribution:

$$\hat{P} = P_{:,i_2} \left(P_{i_1,i_2}^{-1} \right) P_{i_1,:}$$

The diagram illustrates the cross approximation of a matrix \hat{P} . It is shown as equal to the product of three matrices: $P_{:,i_2}$, $(P_{i_1,i_2})^{-1}$, and $P_{i_1,:}$. The matrix \hat{P} is a 10x10 grid with dark gray blocks along the main diagonal. The matrix $P_{:,i_2}$ is a 10x5 column vector with a gradient from yellow to dark brown. The matrix $(P_{i_1,i_2})^{-1}$ is a 5x5 matrix with a gradient from green to dark blue. The matrix $P_{i_1,:}$ is a 5x10 row vector with a gradient from light purple to dark purple.

Singular value decomposition (SVD)

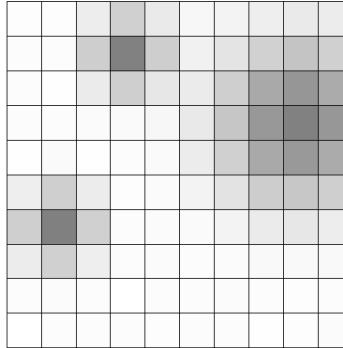

$$X = U \Sigma V^T$$

The diagram illustrates the Singular Value Decomposition (SVD) of a matrix X . It shows the decomposition into three components: U (orthogonal matrix), Σ (diagonal matrix of singular values), and V^T (orthogonal matrix). The components are represented by small 2x2 grids: U is gray, Σ is blue, and V^T has a green and white checkerboard pattern.

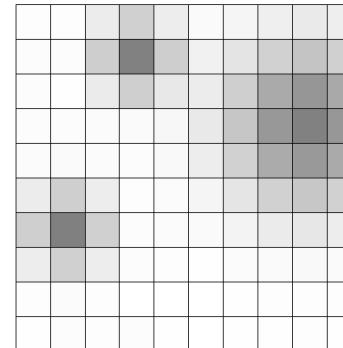

→ Can be used to approximate an unknown matrix **by querying rows and columns of the matrix** in an iterative manner, while estimating the rank of the matrix

Example: Tensor train for global optimization

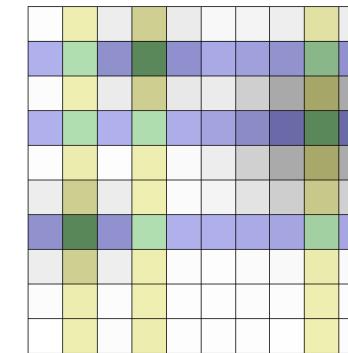

Cross approximation (skeleton decomposition) of a probability distribution:

Original distribution

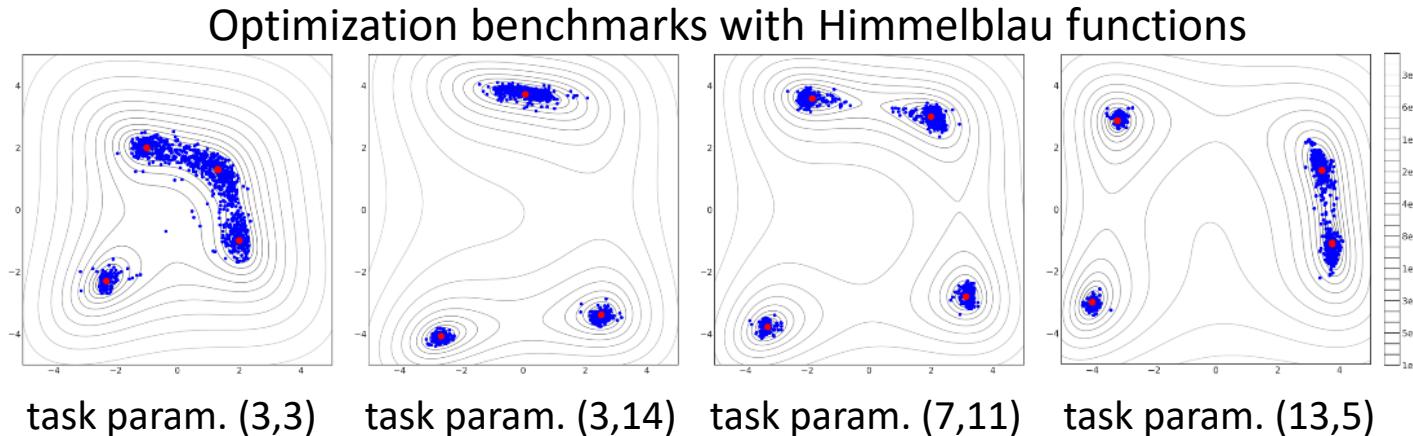

Reconstructed distribution
(rank 3 approximation)

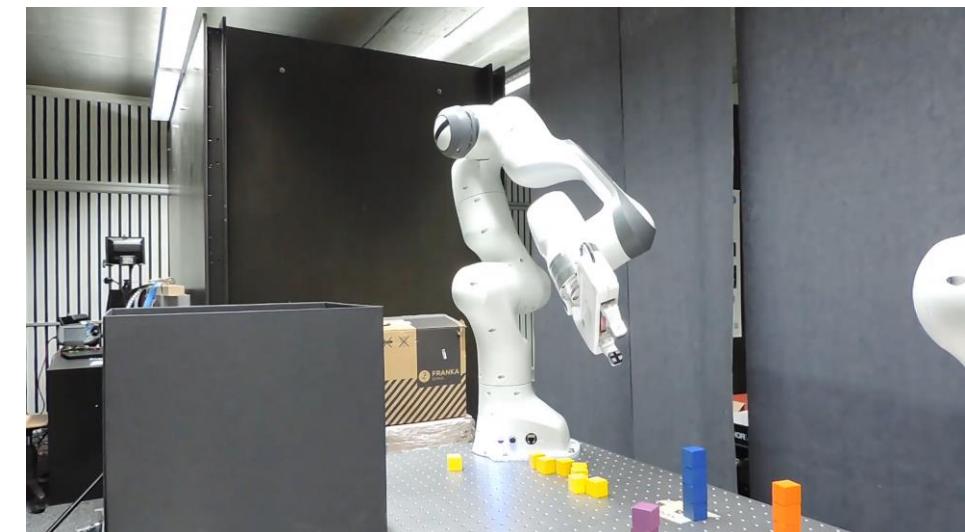

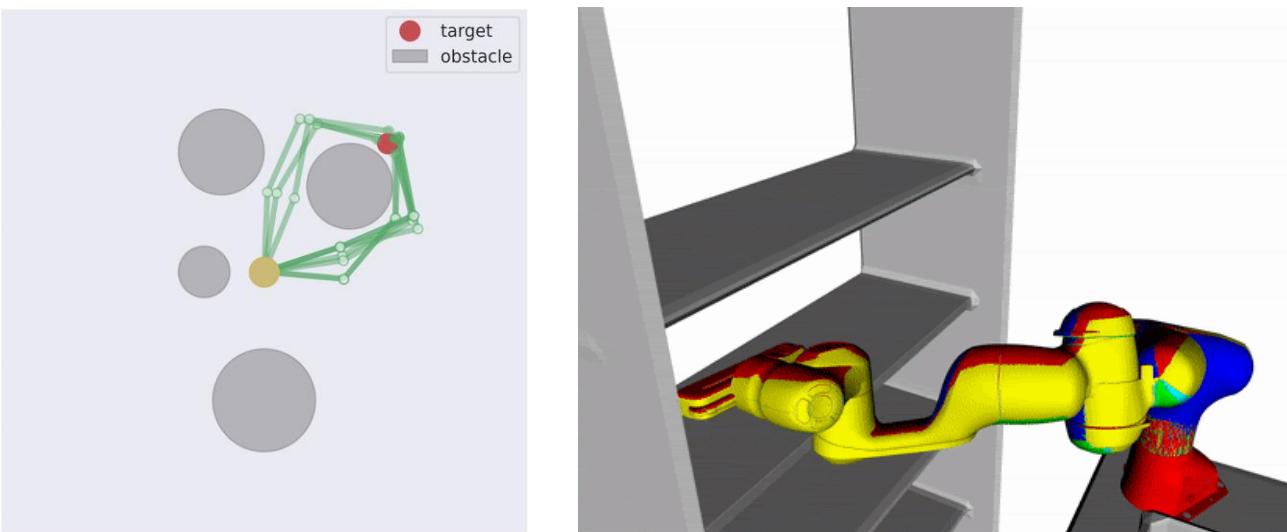

→ Can be used to approximate an unknown matrix **by querying rows and columns of the matrix** in an iterative manner, while estimating the rank of the matrix

Example: Tensor train for global optimization

Tracking in the frequency domain

$$\min_{u(t)} \sum_{k \in \mathcal{K}} \Lambda_k (w_k - \hat{w}_k)^2$$

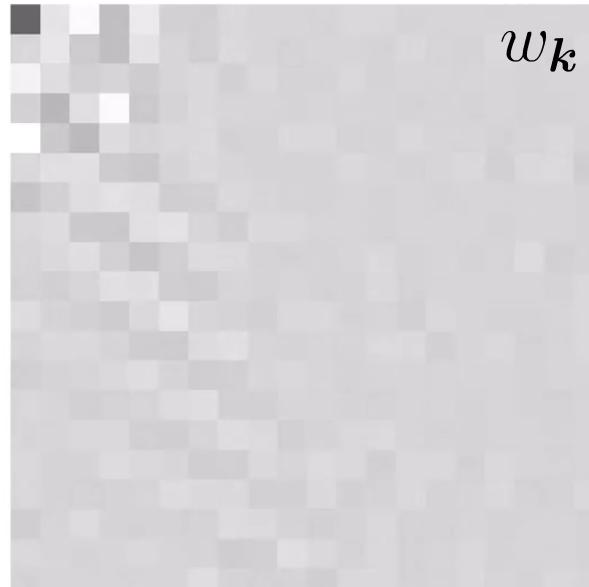

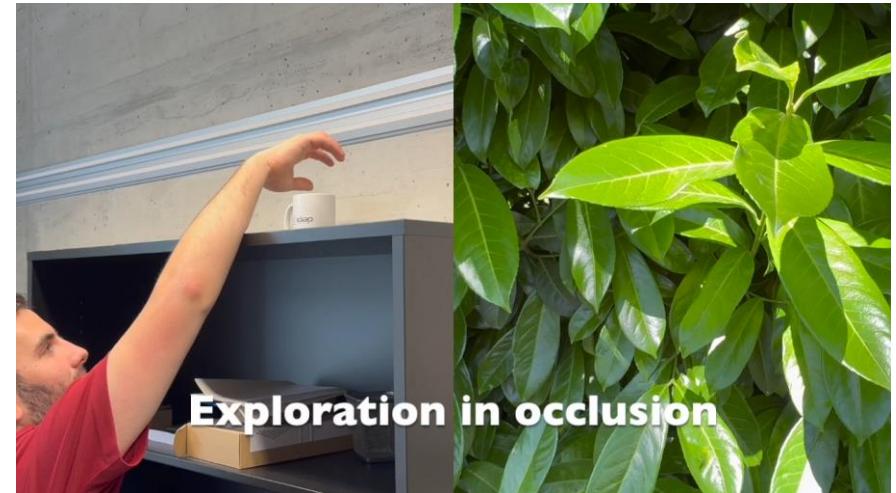

fixed weights

Input: Spatial distribution
Output: Control commands

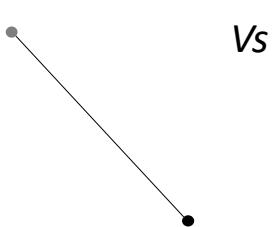

Aim: Matching Fourier series coefficients

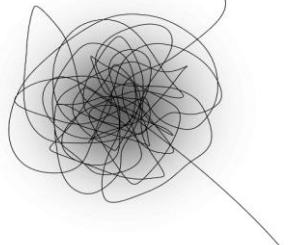

Ergodic control for insertion tasks

Ergodic control as search behavior

Point tracking

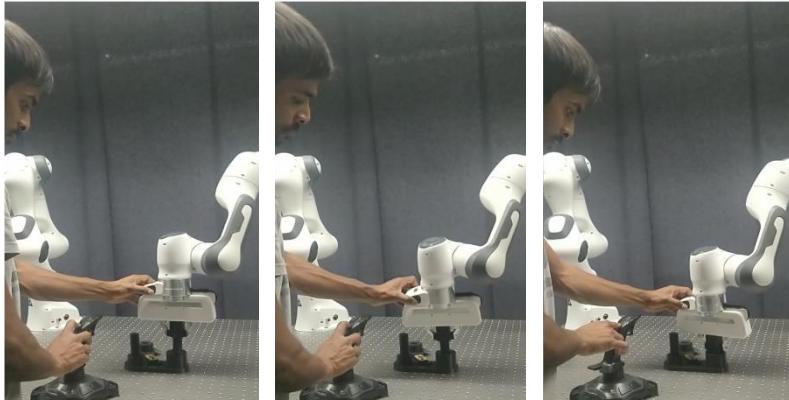

Distribution tracking

vs

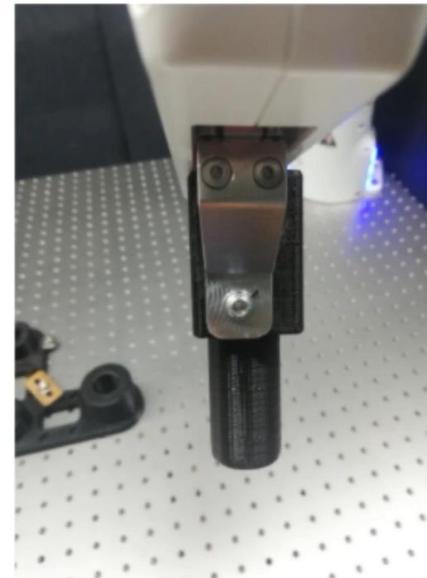

The **Fourier basis functions** expansion does not scale well for more than 3 dimensions:
→ low-rank tensor factorization is required

Insertion task (Siemens gears benchmark)

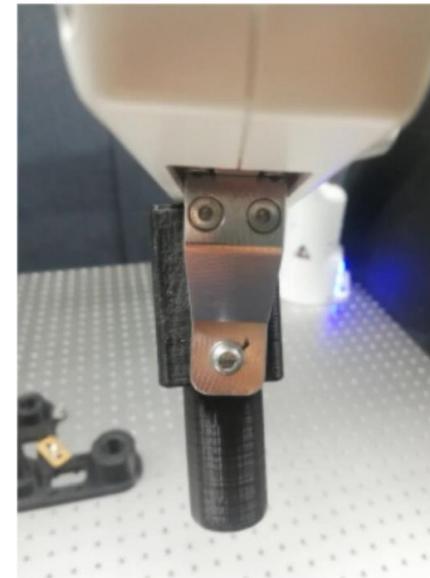

Demonstration of insertion pose variations to provide a spatial reference distribution

We evaluate the proposed approach using two different peg grasps:

Grasp #1

Grasp #2
